SPECTRALBRIDGE / EARTH LAB

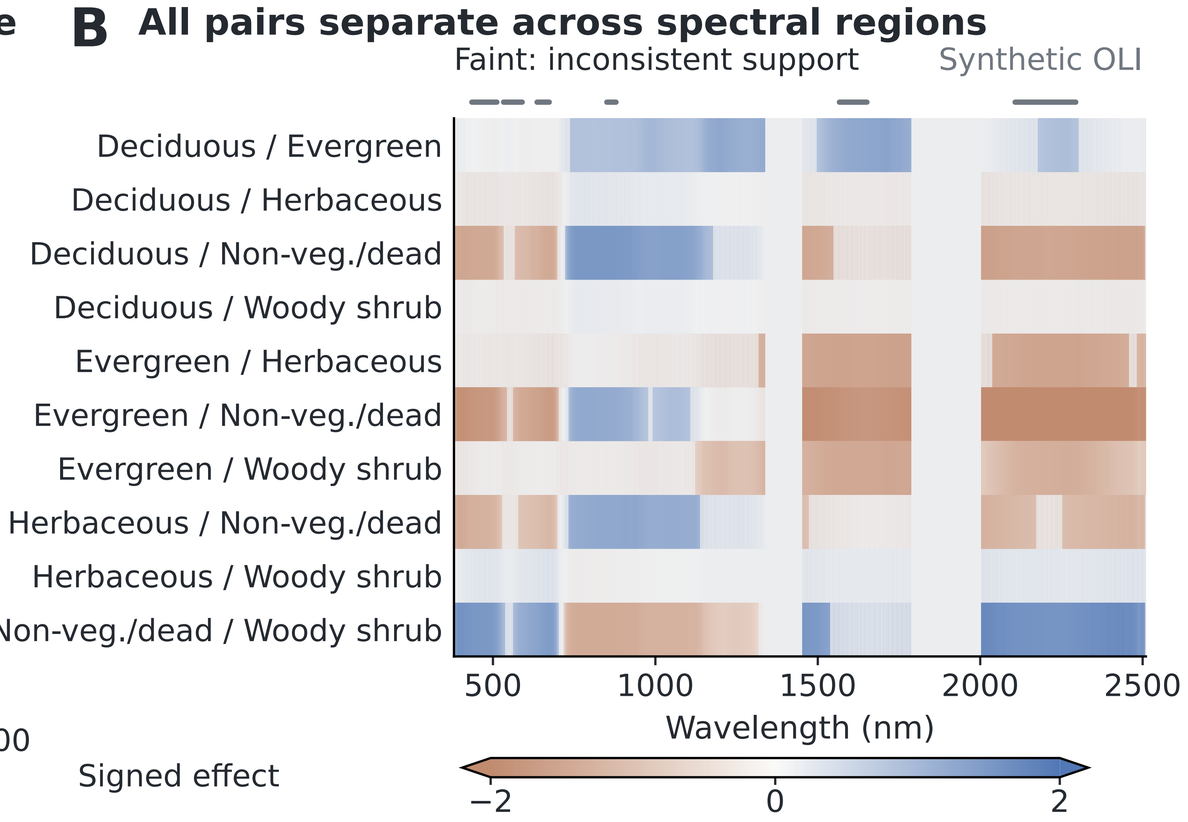

Reading vegetation through spectra

Distinct spectral signatures. Uneven transfer. Ambiguous mixtures.

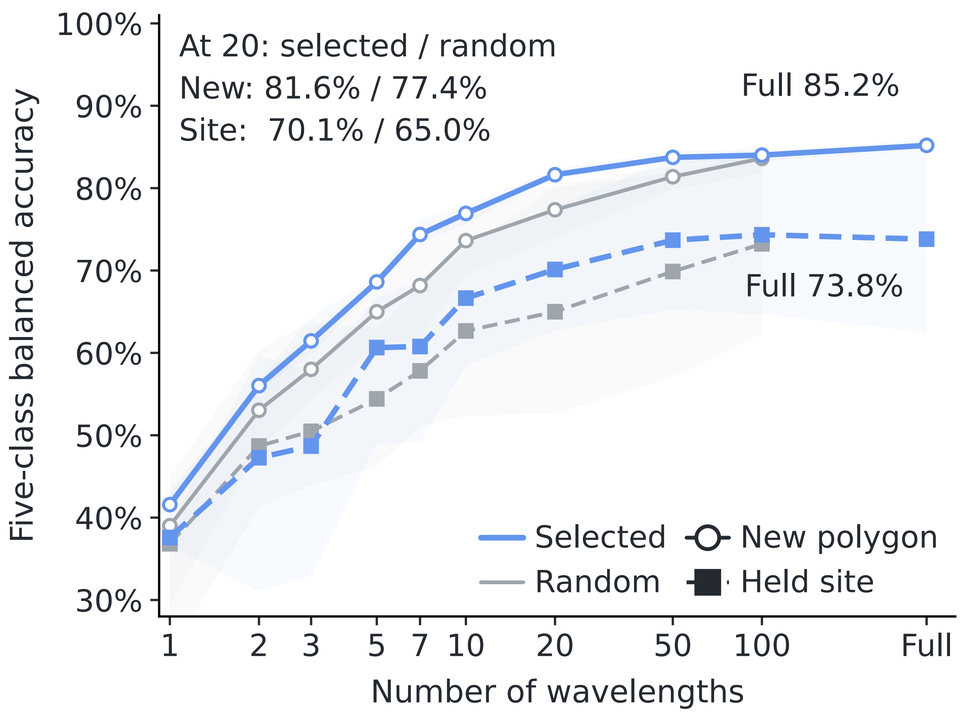

A Category spectra show clear structure

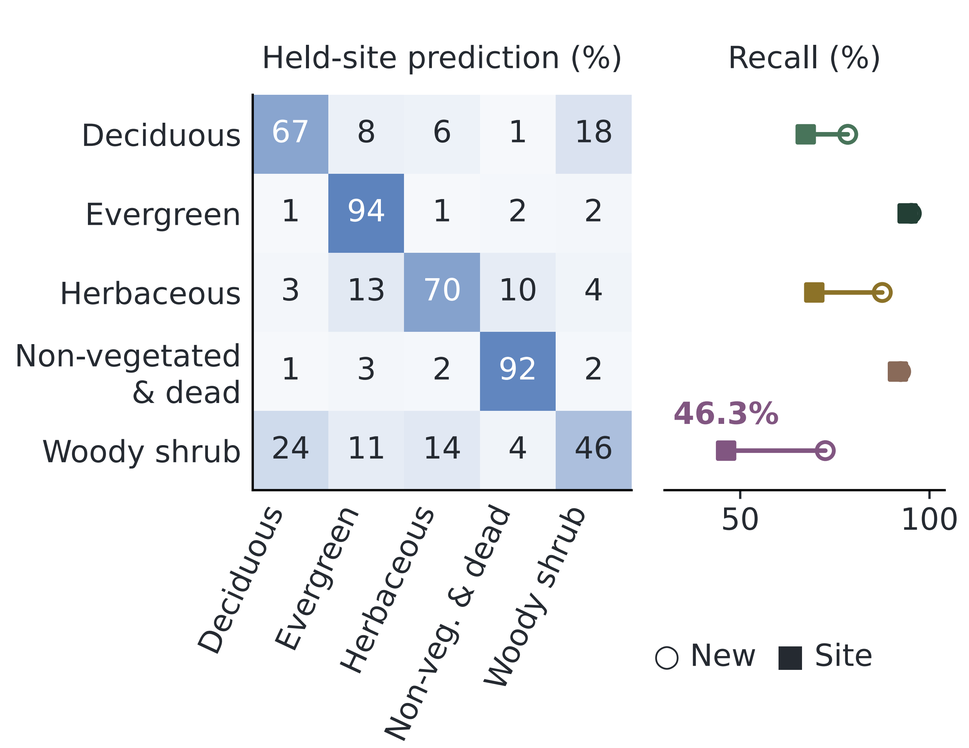

B All pairs separate across spectral regions

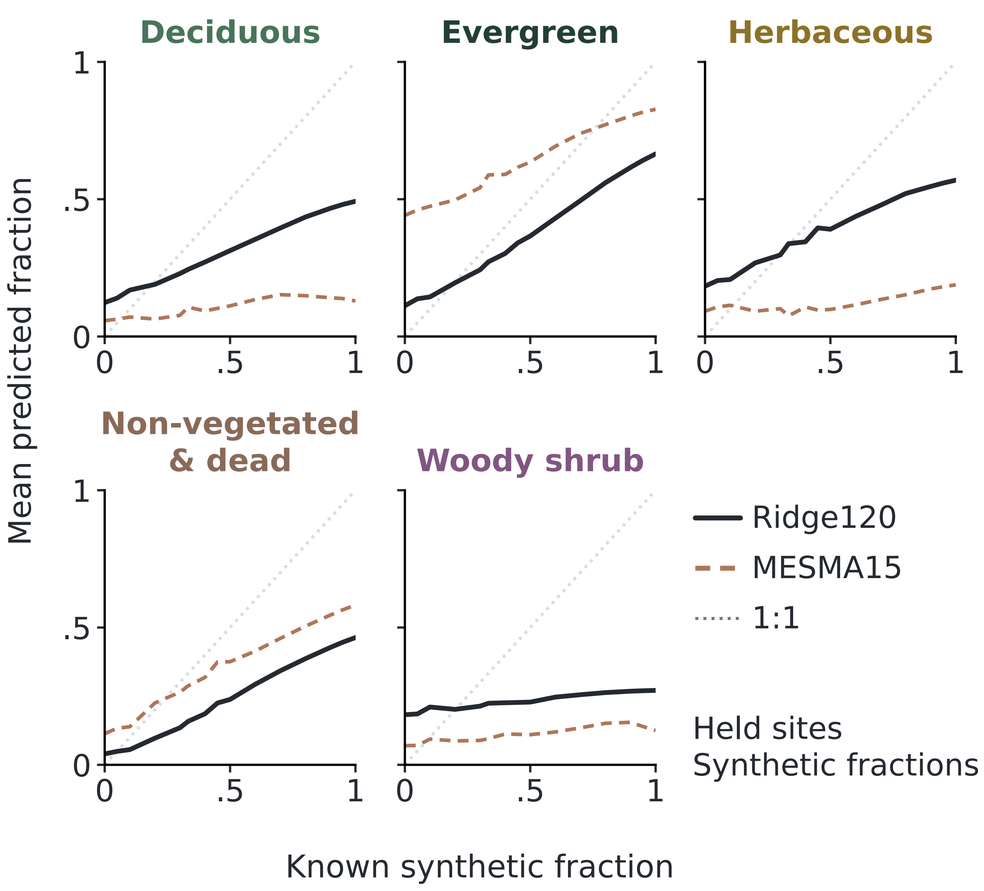

C More wavelengths improve recognition

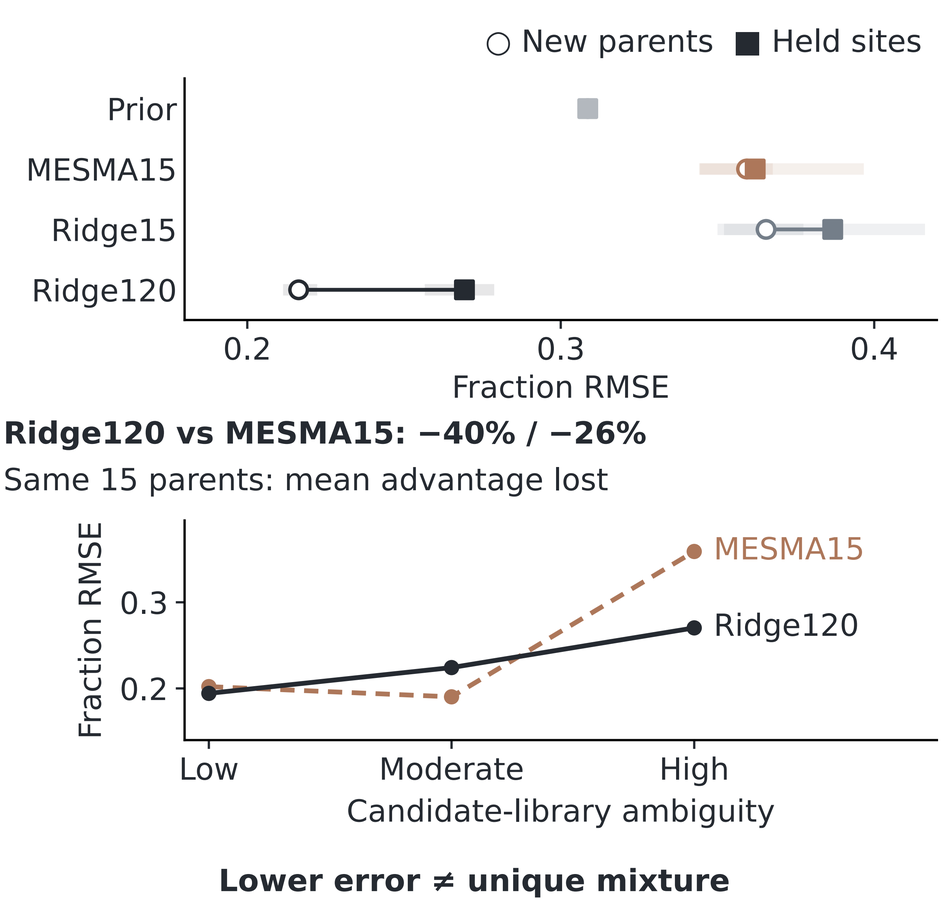

D Category transfer is uneven

E Fraction recovery differs by category

F Richer libraries help; ambiguity remains

Lower error ≠ unique mixture

THE TAKEAWAY

Spectral differences support recognition; lower mixture error does not establish unique composition.

Abundance panels use controlled synthetic fractions. Independent field validation and physical-unit checks remain outstanding.
